

Lab: Calling Power Automate HTTP Endpoint from an External Website

Objective

Build a simple web page that sends data to a Power Automate flow through an HTTP endpoint and displays the response.

Architecture

```
HTML Website
  |
  | HTTP POST
  v
Power Automate Flow
  |
  | Response
  v
HTML Website
```

Step 1: Create Power Automate Flow

Navigate to:

```
Power Automate
→ Create
→ Instant Cloud Flow
```

Select Trigger:

```
When an HTTP request is received
```

Flow Name:

External Website API Demo

Step 2: Configure HTTP Trigger

Who can trigger the flow

Select:

Anyone

Request Body JSON Schema

Paste:

```
{
  "type": "object",
  "properties": {
    "name": {
      "type": "string"
    },
    "question": {
      "type": "string"
    }
  }
}
```

Step 3: Add Compose Action

Add Action:

Compose

Input:

```
Hello @{{triggerBody()?['name']}}, you asked: @{{triggerBody()?['question']}}
```

Step 4: Add Response Action

Add Action:

Response

Configure:

Status Code

200

Headers

```
{  
  "Content-Type": "application/json"  
}
```

Body

```
{  
  "message": "@{{outputs('Compose')}}"  
}
```

Step 5: Publish Flow

Click:

Publish

Important:

Save Draft ≠ Publish

The HTTP URL is generated only after publishing.

Step 6: Copy Endpoint URL

Open the HTTP Trigger again.

You will now see:

HTTP URL

Example:

`https://prod-123.westus.logic.azure.com/...`

Copy the URL.

Step 7: Create HTML Page

Create:

`index.html`

HTML Code

```
<!DOCTYPE html>
<html>
```

```
<head>
  <title>Power Automate API Demo</title>
</head>

<body>

  <h2>Power Automate HTTP Demo</h2>

  <label>Name</label>
  <br>
  <input id="name">
  <br><br>

  <label>Question</label>
  <br>
  <input id="question">
  <br><br>

  <button onclick="callFlow()">
    Call Power Automate
  </button>

  <hr>

  <h3>Response</h3>

  <div id="result"></div>

  <script>

    async function callFlow() {

      const url =
        "PASTE_HTTP_ENDPOINT_HERE";

      const requestBody = {

        name:
          document.getElementById("name").value,

        question:
          document.getElementById("question").value

      };
    }
  </script>
</body>
```

```
const response =
  await fetch(url, {

    method: "POST",

    headers: {
      "Content-Type": "application/json"
    },

    body:
      JSON.stringify(requestBody)
  });

const data =
  await response.json();

document.getElementById("result")
  .innerText =
    data.message;
}

</script>

</body>

</html>
```

Step 8: Replace Endpoint

Replace:

```
PASTE_HTTP_ENDPOINT_HERE
```

with the copied Power Automate HTTP URL.

Step 9: Run Application

Open:

```
index.html
```

in a browser.

Test Data

Name

```
Abdullah
```

Question

```
How do I learn Power Platform?
```

Click:

```
Call Power Automate
```

Expected Output

```
Hello Abdullah, you asked: How do I learn Power Platform?
```

Request Payload

Website sends:

```
{  
  "name": "Abdullah",
```

```
"question": "How do I learn Power Platform?"
}
```

Response Payload

Power Automate returns:

```
{
  "message": "Hello Abdullah, you asked: How do I learn Power Platform?"
}
```

Learning Outcomes

By completing this lab, participants will learn:

- Creating HTTP-triggered Power Automate flows
 - Defining JSON request schemas
 - Using triggerBody() expressions
 - Returning custom HTTP responses
 - Consuming REST APIs using JavaScript Fetch API
 - Integrating external websites with Power Automate
 - Understanding request/response architecture
-

Real-World Use Cases

- Website Contact Forms
- AI Chatbots
- Employee Self-Service Portals
- Ticket Creation Systems
- Leave Management Systems
- Survey Collection Applications
- Approval Request Portals
- Third-Party System Integrations
- Low-Code API Development with Power Automate
